Keyframe Interpolation

FUNDAMENTALS OF COMPUTER GRAPHICS

Stanford CS248B, Fall 2022

19th century keyframe animation

- Two conditions to make moving images in 19th century
 - at least 10 frames per second
 - a period of blackness between images

Keyframes

Modern Zoetrope

- Instead of drawing figures, animators specify keyframes in 3D.
- Each keyframe is defined by a set of parameters, such as body position and joint angles.
- Zoetrope uses a physical device to interpolate keyframes, but we need an algorithm to interpolate in computer animation.

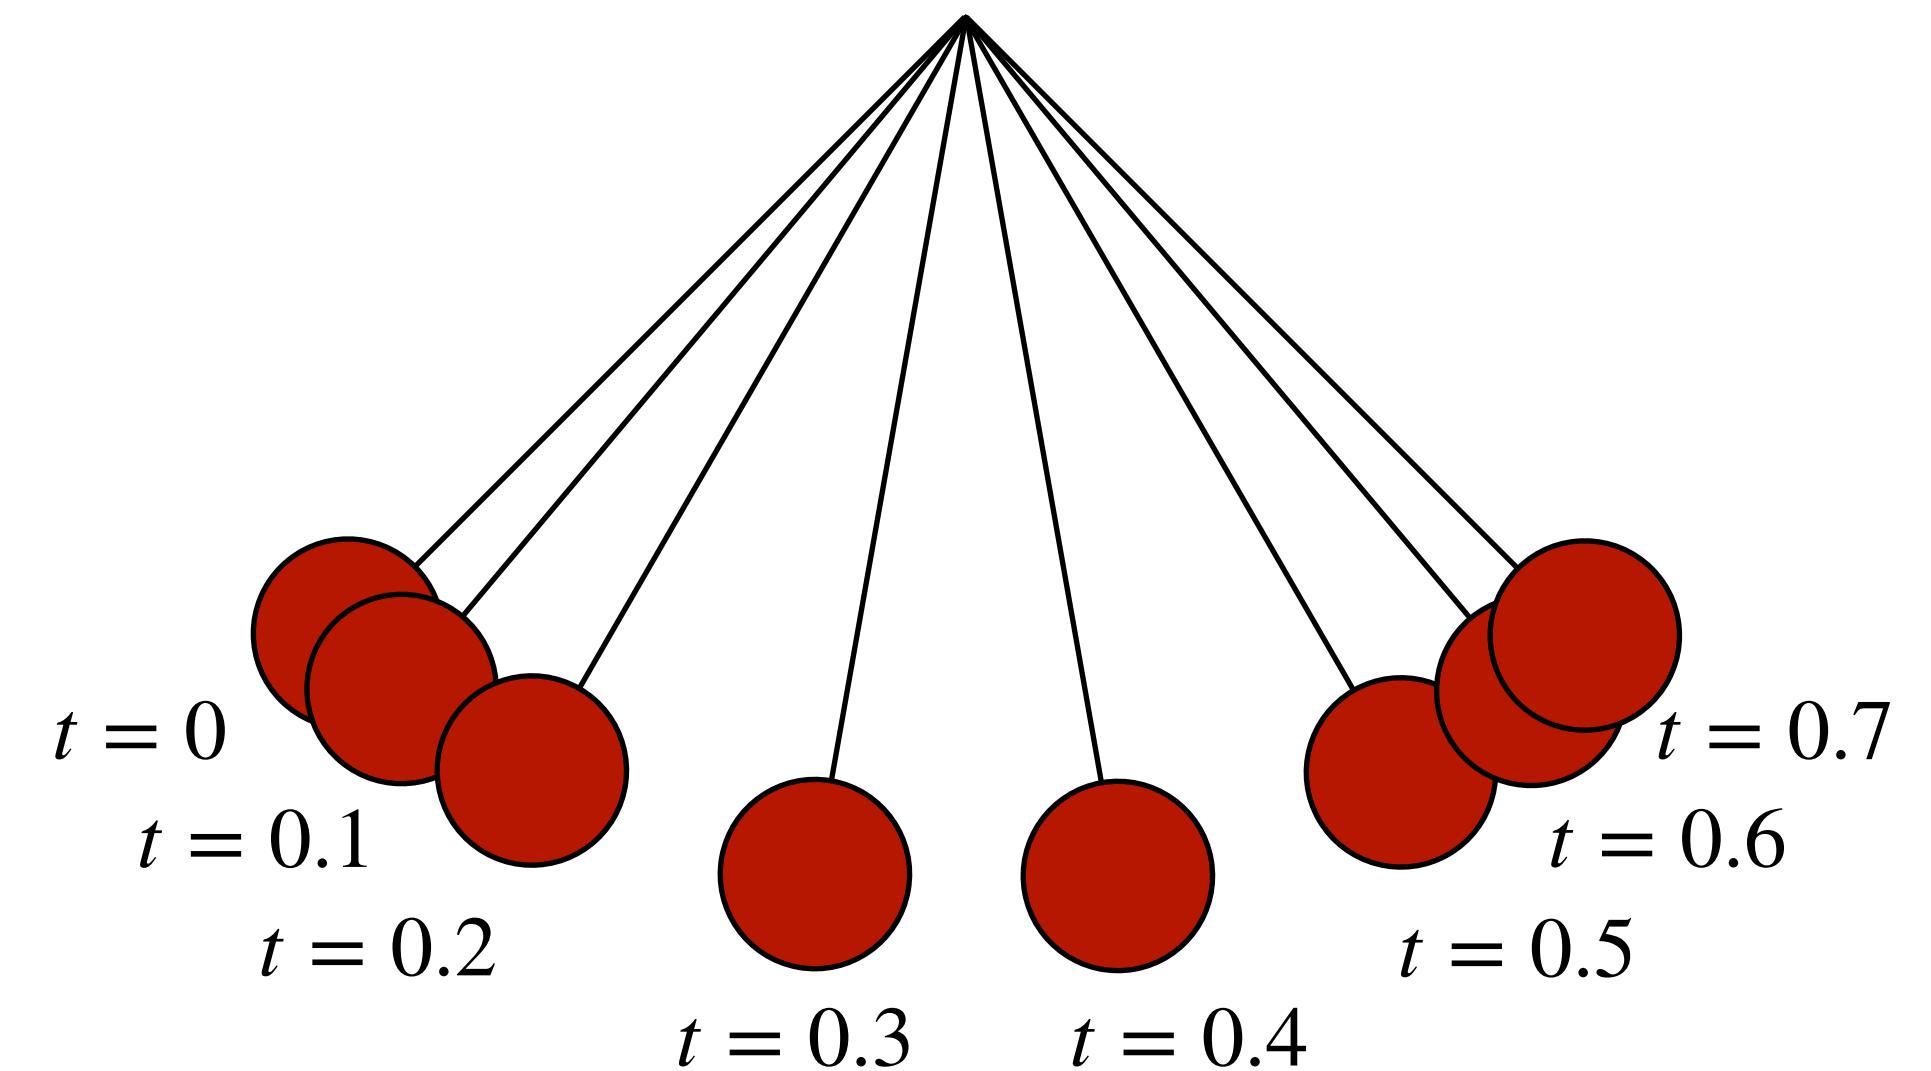

Interpolation keyframes

- Use simple linear interpolation to create in-between frames.

$$x = x_0 + \frac{t - t_0}{t_1 - t_0}(x_1 - x_0)$$

- What is the problem?

- Motion is not smooth, especially when it's fast.
- The string length is not constant.

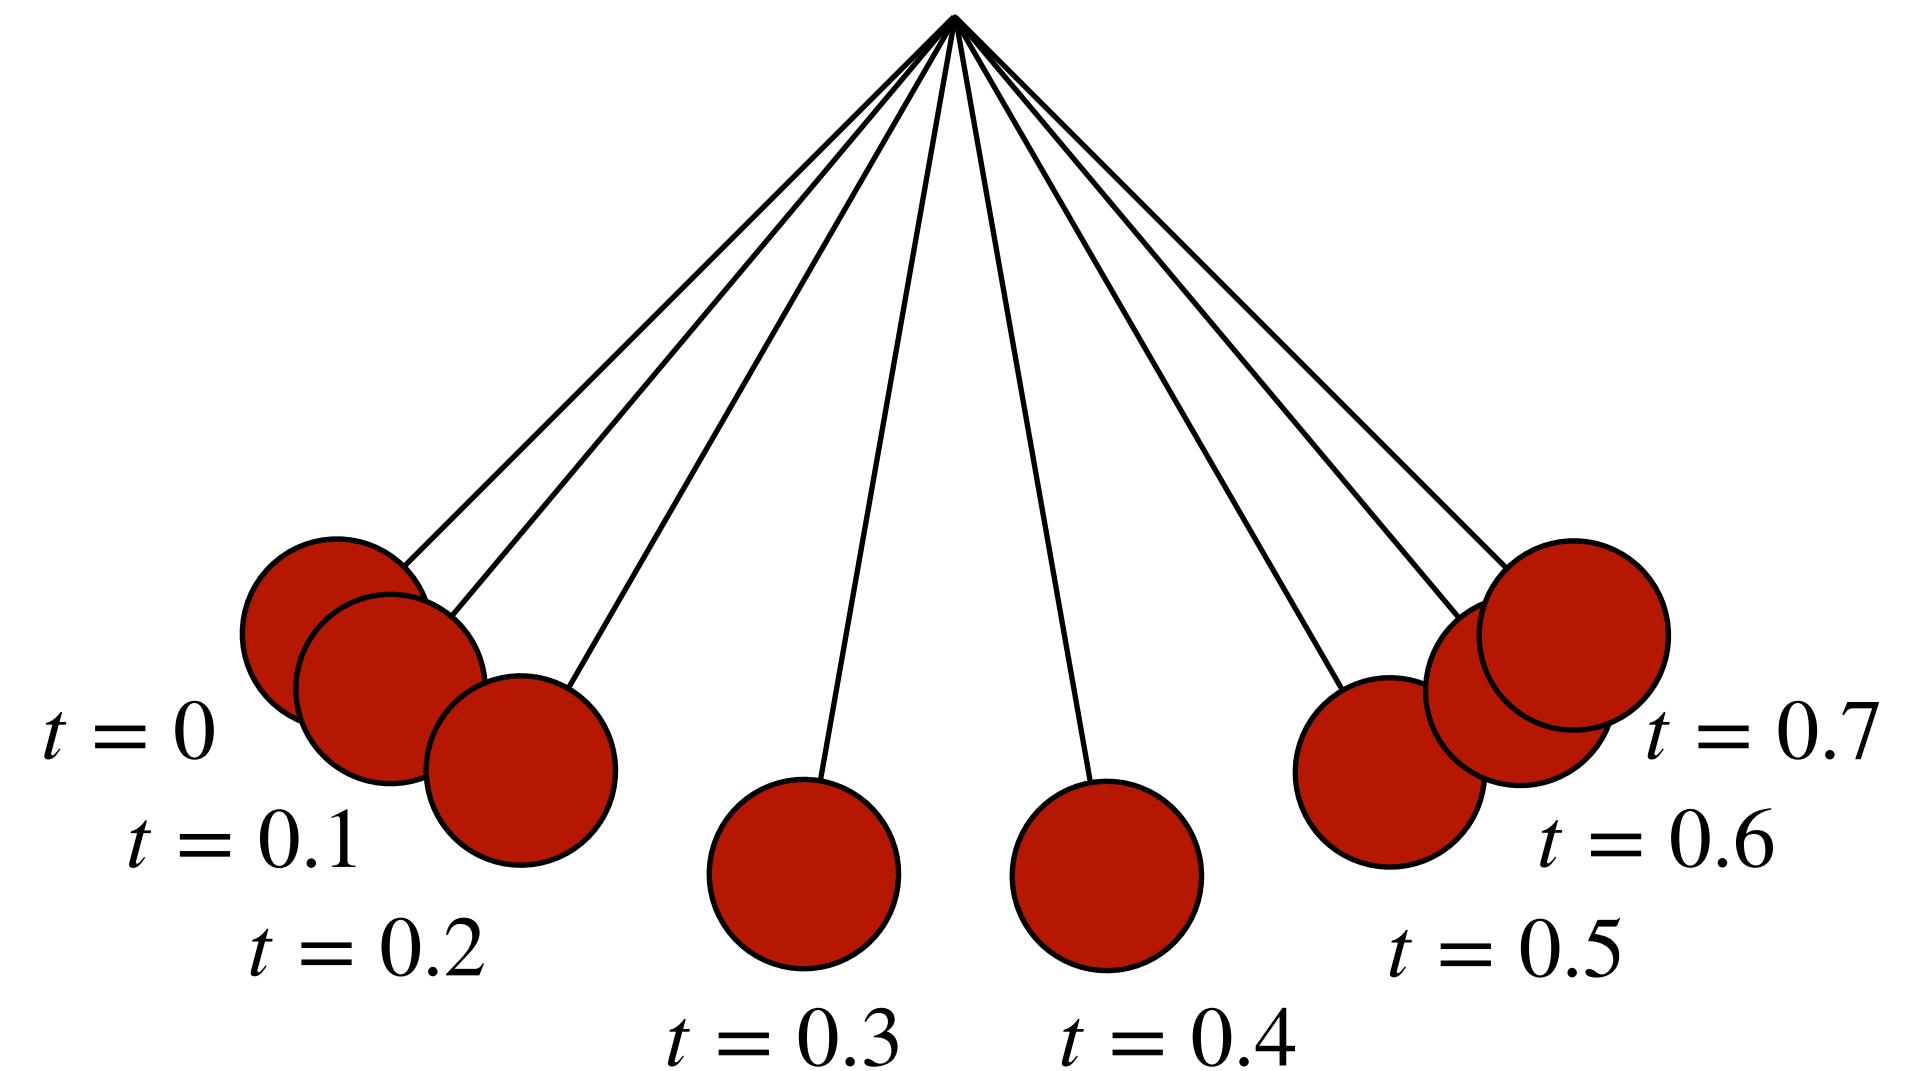

Cubic interpolation

- Use three cubic curves to interpolate between two consecutive 3D positions.

$$x(t') = a_x t'^3 + b_x t'^2 + c_x t' + d_x$$

$$y(t') = a_y t'^3 + b_y t'^2 + c_y t' + d_y$$

$$z(t') = a_z t'^3 + b_z t'^2 + c_z t' + d_z$$

- Normalize the time between two keyframes such that $0 \leq t' \leq 1$.

$$t' = \frac{t - t_0}{t_1 - t_0}$$

Compact representation

■ Put it in a more compact representation

$$x(t') = a_x t'^3 + b_x t'^2 + c_x t' + d_x$$

$$y(t') = a_y t'^3 + b_y t'^2 + c_y t' + d_y$$

$$z(t') = a_z t'^3 + b_z t'^2 + c_z t' + d_z$$

Put them in the matrix representation
and factor out the time variable.

$$\mathbf{Q}(t') = [x(t') \ y(t') \ z(t')] = [t'^3 \ t'^2 \ t' \ 1] \begin{bmatrix} a_x & a_y & a_z \\ b_x & b_y & b_z \\ c_x & c_y & c_z \\ d_x & d_y & d_z \end{bmatrix} = \mathbf{T}\mathbf{C}$$

Compact representation

■ Put it in a more compact representation

$$x(t') = a_x t'^3 + b_x t'^2 + c_x t' + d_x$$

$$y(t') = a_y t'^3 + b_y t'^2 + c_y t' + d_y$$

$$z(t') = a_z t'^3 + b_z t'^2 + c_z t' + d_z$$

It's nice to have a representation that factors out the time because we can easily compute the gradient of the curve.

$$\mathbf{Q}(t') = [x(t') \ y(t') \ z(t')] = [t'^3 \ t'^2 \ t' \ 1] \begin{bmatrix} a_x & a_y & a_z \\ b_x & b_y & b_z \\ c_x & c_y & c_z \\ d_x & d_y & d_z \end{bmatrix} = \mathbf{TC}$$

Quiz

- It's nice to factor the time because it also

What is the first derivative function of $\mathbf{Q}(t')$?

$$\dot{\mathbf{Q}}(t') = \dot{\mathbf{T}}\mathbf{C} = \frac{d}{dt'} [t'^3 \ t'^2 \ t' \ 1]\mathbf{C} = [3t'^2 \ 2t' \ 1 \ 0]\mathbf{C}$$

What about $\ddot{\mathbf{Q}}(t')$?

$$\ddot{\mathbf{Q}}(t') = \ddot{\mathbf{T}}\mathbf{C} = [6t' \ 2 \ 0 \ 0]\mathbf{C}$$

These derivative functions will be
useful later...

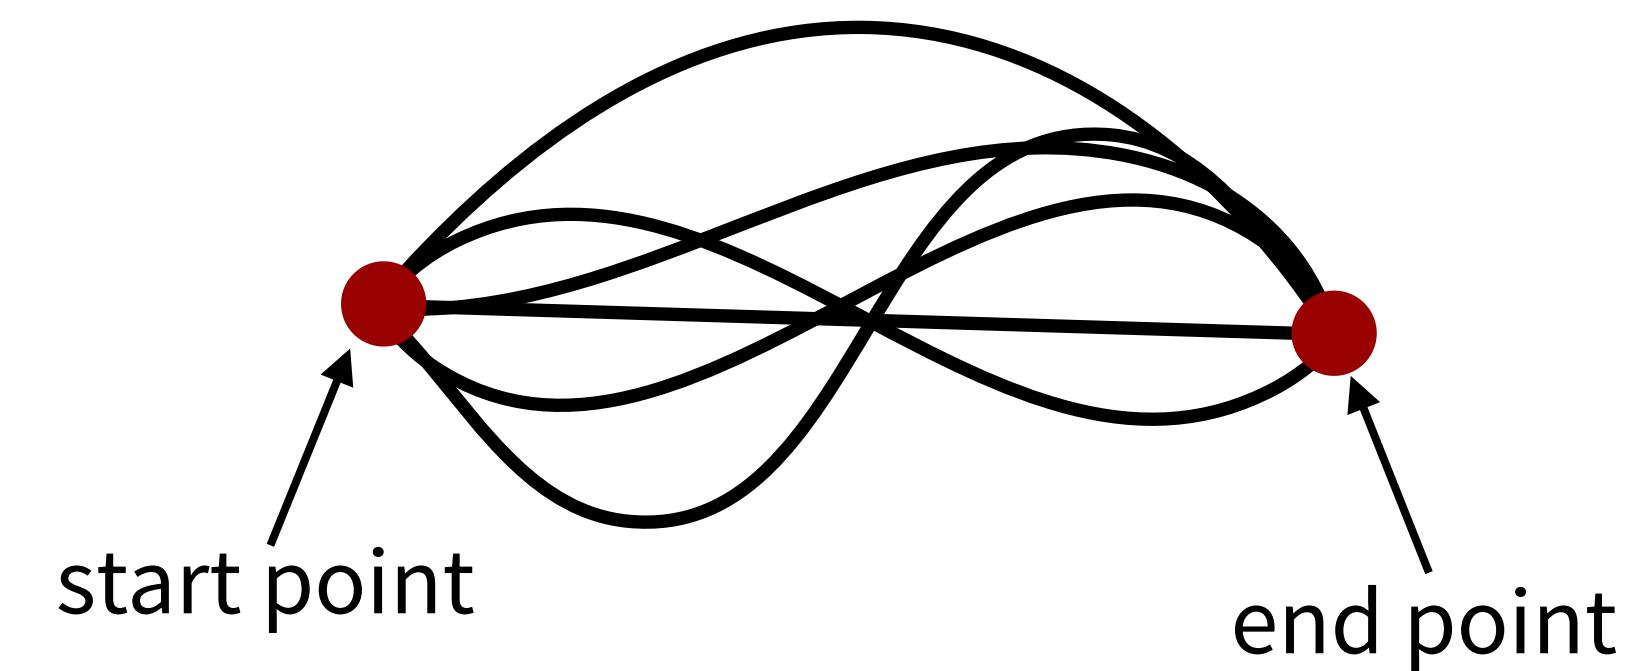

Compact representation

- How do we determine the matrix \mathbf{C} ?
 - For each cubic function, we need four constraints to determine it.
- Two constraints come from end points, what about other two constraints?
 - Desired shape of the curve.

 - Desired shape of the curve.

Compact representation

- How do we enforce these geometry constraints in C? The current representation of C is a bit inconvenient.

$$\mathbf{C} = \begin{bmatrix} a_x & a_y & a_z \\ b_x & b_y & b_z \\ c_x & c_y & c_z \\ d_x & d_y & d_z \end{bmatrix}$$

- We can reparameterize \mathbf{C} as a product of two matrices.

$$\mathbf{C} = \mathbf{M}\mathbf{G} = \begin{bmatrix} m_{11} & m_{12} & m_{13} & m_{14} \\ m_{21} & m_{22} & m_{23} & m_{24} \\ m_{31} & m_{32} & m_{33} & m_{34} \\ m_{41} & m_{42} & m_{43} & m_{44} \end{bmatrix} \begin{bmatrix} g_{1x} & g_{1y} & g_{1z} \\ g_{2x} & g_{2y} & g_{2z} \\ g_{3x} & g_{3y} & g_{3z} \\ g_{4x} & g_{4y} & g_{4z} \end{bmatrix}$$

Basis matrix \mathbf{M} falls out of algebra manipulation.

Geometry matrix \mathbf{G} stores parameters of desired geometry constraints. We need **four** of them.

- We can reparameterize \mathbf{C} as a product of two matrices.

$$\mathbf{C} = \mathbf{MG} = \begin{bmatrix} m_{11} & m_{12} & m_{13} & m_{14} \\ m_{21} & m_{22} & m_{23} & m_{24} \\ m_{31} & m_{32} & m_{33} & m_{34} \\ m_{41} & m_{42} & m_{43} & m_{44} \end{bmatrix} \begin{bmatrix} g_{1x} & g_{1y} & g_{1z} \\ g_{2x} & g_{2y} & g_{2z} \\ g_{3x} & g_{3y} & g_{3z} \\ g_{4x} & g_{4y} & g_{4z} \end{bmatrix}$$

Compact representation

$$\mathbf{Q} = \mathbf{T}\mathbf{M}\mathbf{G} = [t^3 \quad t^2 \quad t' \quad 1] \begin{bmatrix} m_{11} & m_{12} & m_{13} & m_{14} \\ m_{21} & m_{22} & m_{23} & m_{24} \\ m_{31} & m_{32} & m_{33} & m_{34} \\ m_{41} & m_{42} & m_{43} & m_{44} \end{bmatrix} \begin{bmatrix} g_{1x} & g_{1y} & g_{1z} \\ g_{2x} & g_{2y} & g_{2z} \\ g_{3x} & g_{3y} & g_{3z} \\ g_{4x} & g_{4y} & g_{4z} \end{bmatrix}$$

Complex curves

- What if we want to model a curve that passes through these points?

Complex curves

- What if we want to model a curve that passes through these points?

- Problem with higher order polynomials
 - Wiggly curves
 - No local control

Splines

- A piecewise polynomial that has locally very simple form, yet be globally flexible and smooth
- There are three nice properties of splines we'd like to have
 - Continuity
 - Local control
 - Interpolation

Continuity

- C^0 : positions coincide, velocities don't

Continuity

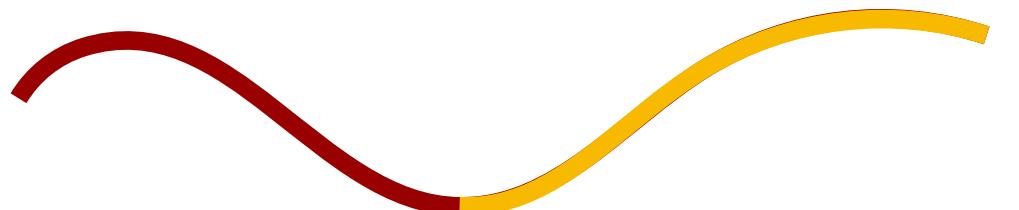

- C^0 : positions coincide, velocities don't

- C^1 : positions and velocities coincide

- C^2 : positions, velocities and accelerations coincide

Often the difference between C^1 and C^2 is not that obvious.

Local control

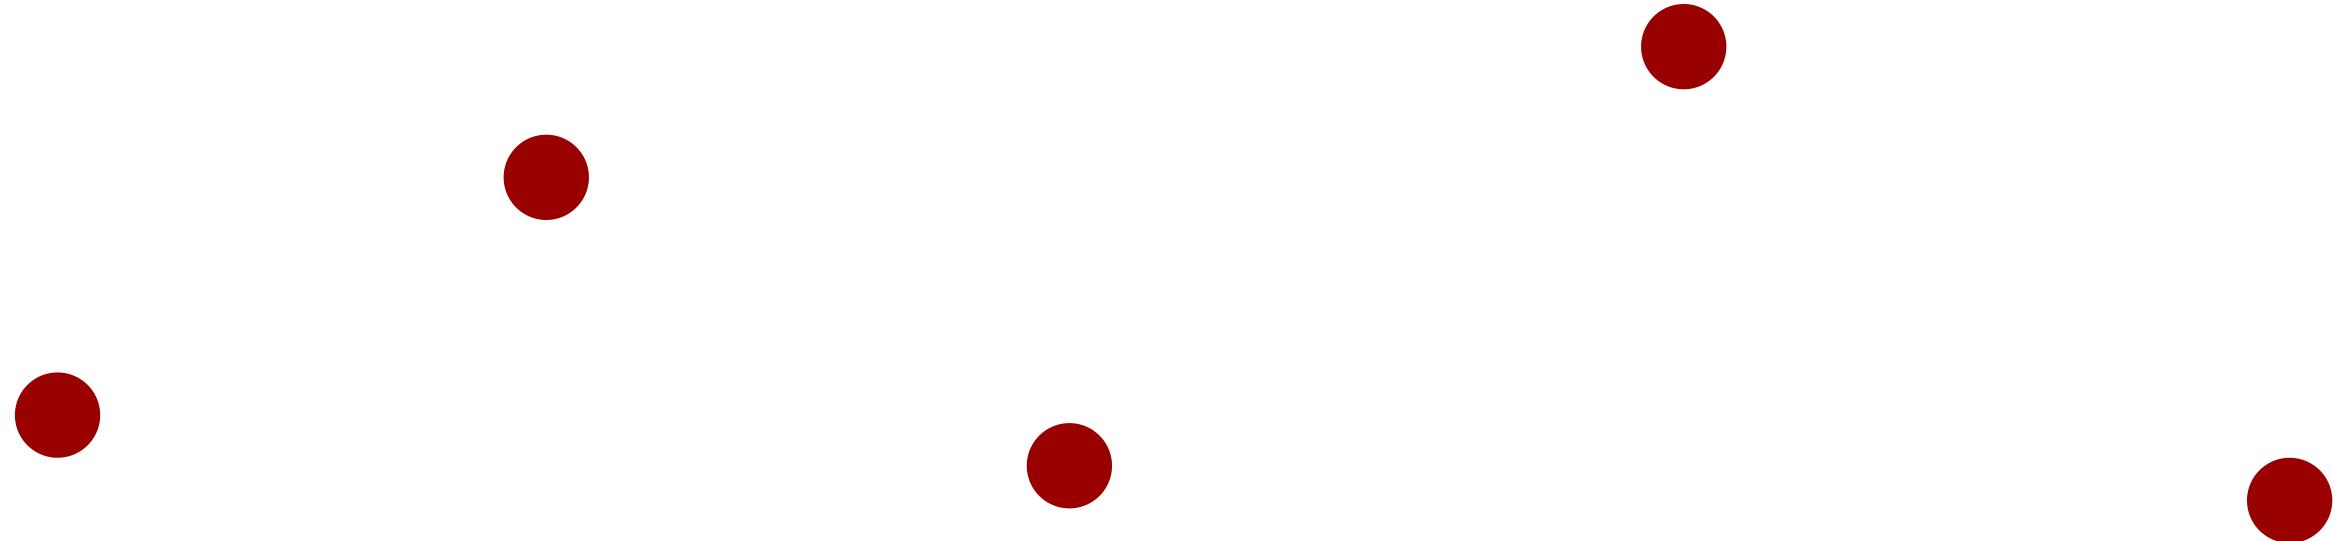

- We'd like to have each control point on the spline only affect some well-defined neighborhood around that point.
- Polynomial functions don't have local control; moving a single keyframe affects the whole curve.

Interpolation

- We'd like to have a spline interpolating the control points so that the spline always passes through every control points.
- Bézier curves do not necessarily pass through all the control points.

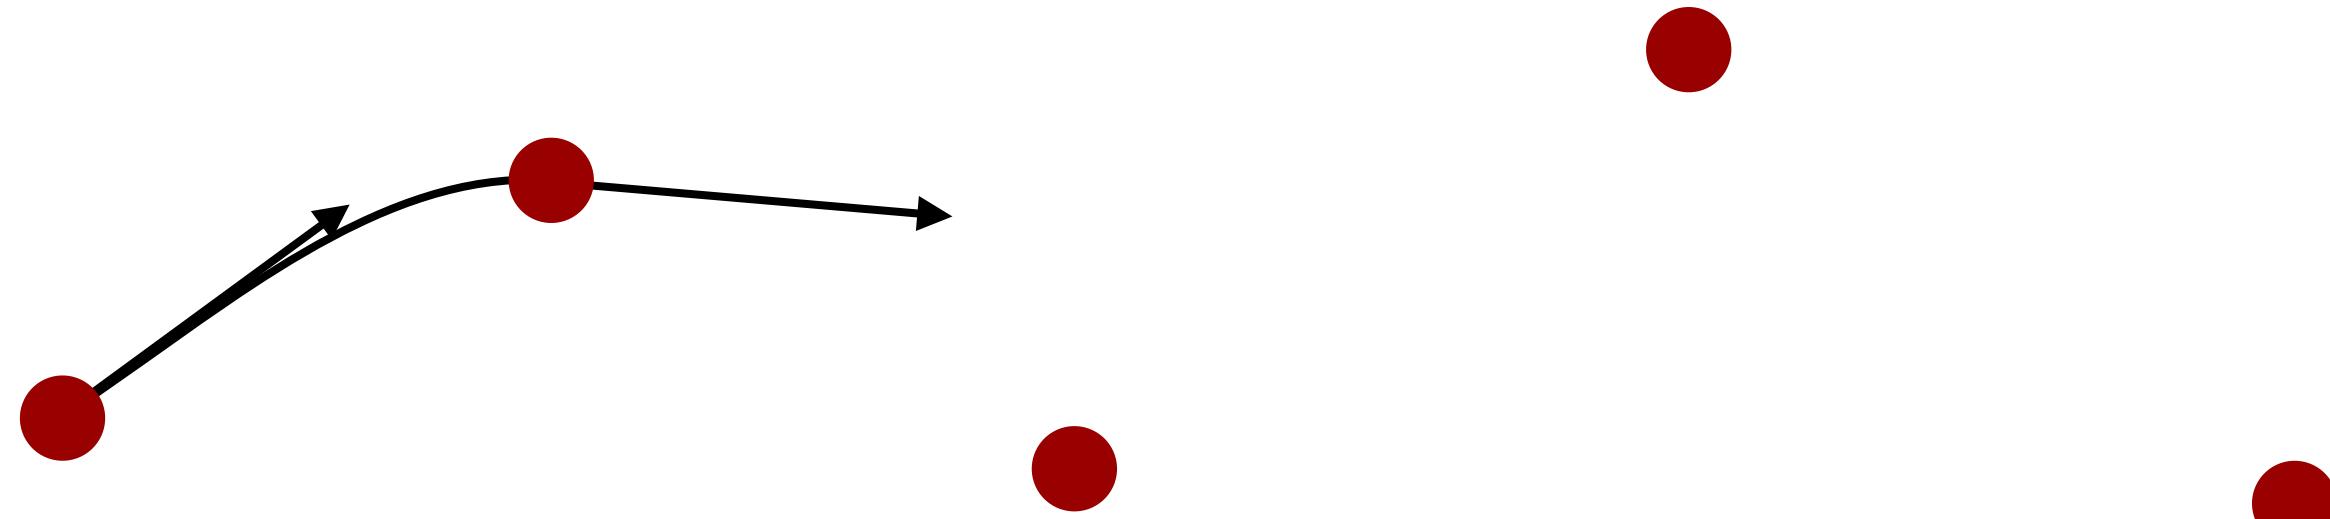

Catmull-Rom splines

Catmull-Rom basis matrix

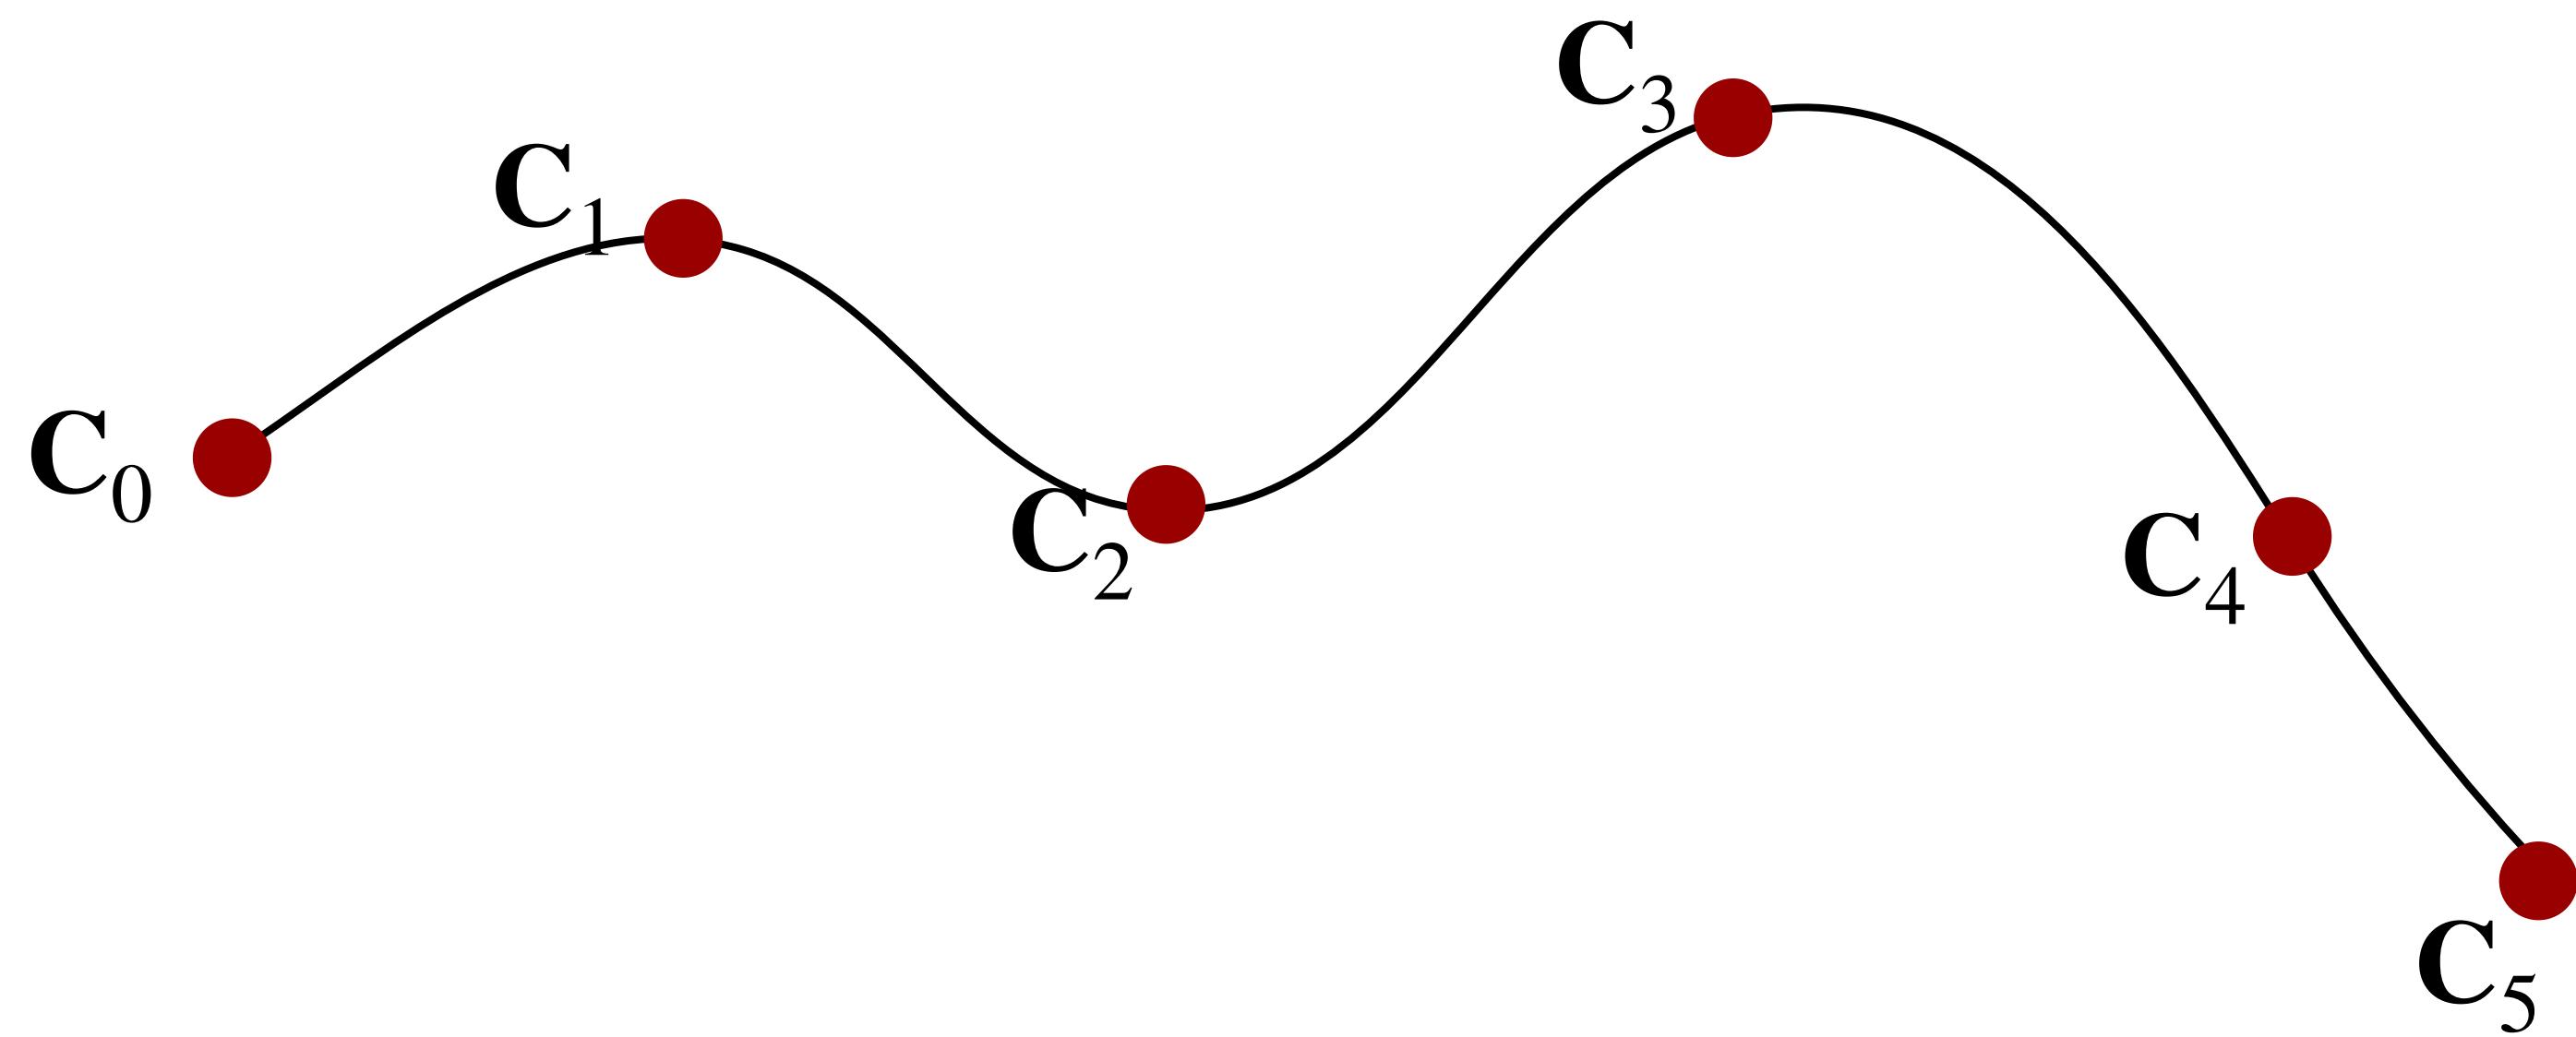

- For interior portion of Catmull-Rom spline, we can derive the basis matrix and use four neighboring keyframes to form the geometry matrix.

$$Q = T \begin{bmatrix} \frac{-1}{2} & \frac{3}{2} & \frac{-3}{2} & \frac{1}{2} \\ 1 & \frac{-5}{2} & 2 & \frac{-1}{2} \\ \frac{-1}{2} & 0 & \frac{1}{2} & 0 \\ 0 & 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} C_1 \\ C_2 \\ C_3 \\ C_4 \end{bmatrix}$$

- For the boundary portion of Catmull-Rom, we can simply use the Hermite curve formulation.

Quiz

Which portion of the Catmull-Rom spline is drawn by this equation?

$$Q = T \begin{bmatrix} \frac{-1}{2} & \frac{3}{2} & \frac{-3}{2} & \frac{1}{2} \\ 1 & \frac{-5}{2} & 2 & \frac{-1}{2} \\ \frac{-1}{2} & 0 & \frac{1}{2} & 0 \\ 0 & 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} C_1 \\ C_2 \\ C_3 \\ C_4 \end{bmatrix}$$

C^2 interpolating splines

- How can we keep the C^2 continuity of B-splines but get interpolation property as well?
- Suppose we have a set of points representing keyframes, our goal is to find a C^2 spline that passes through all the points.

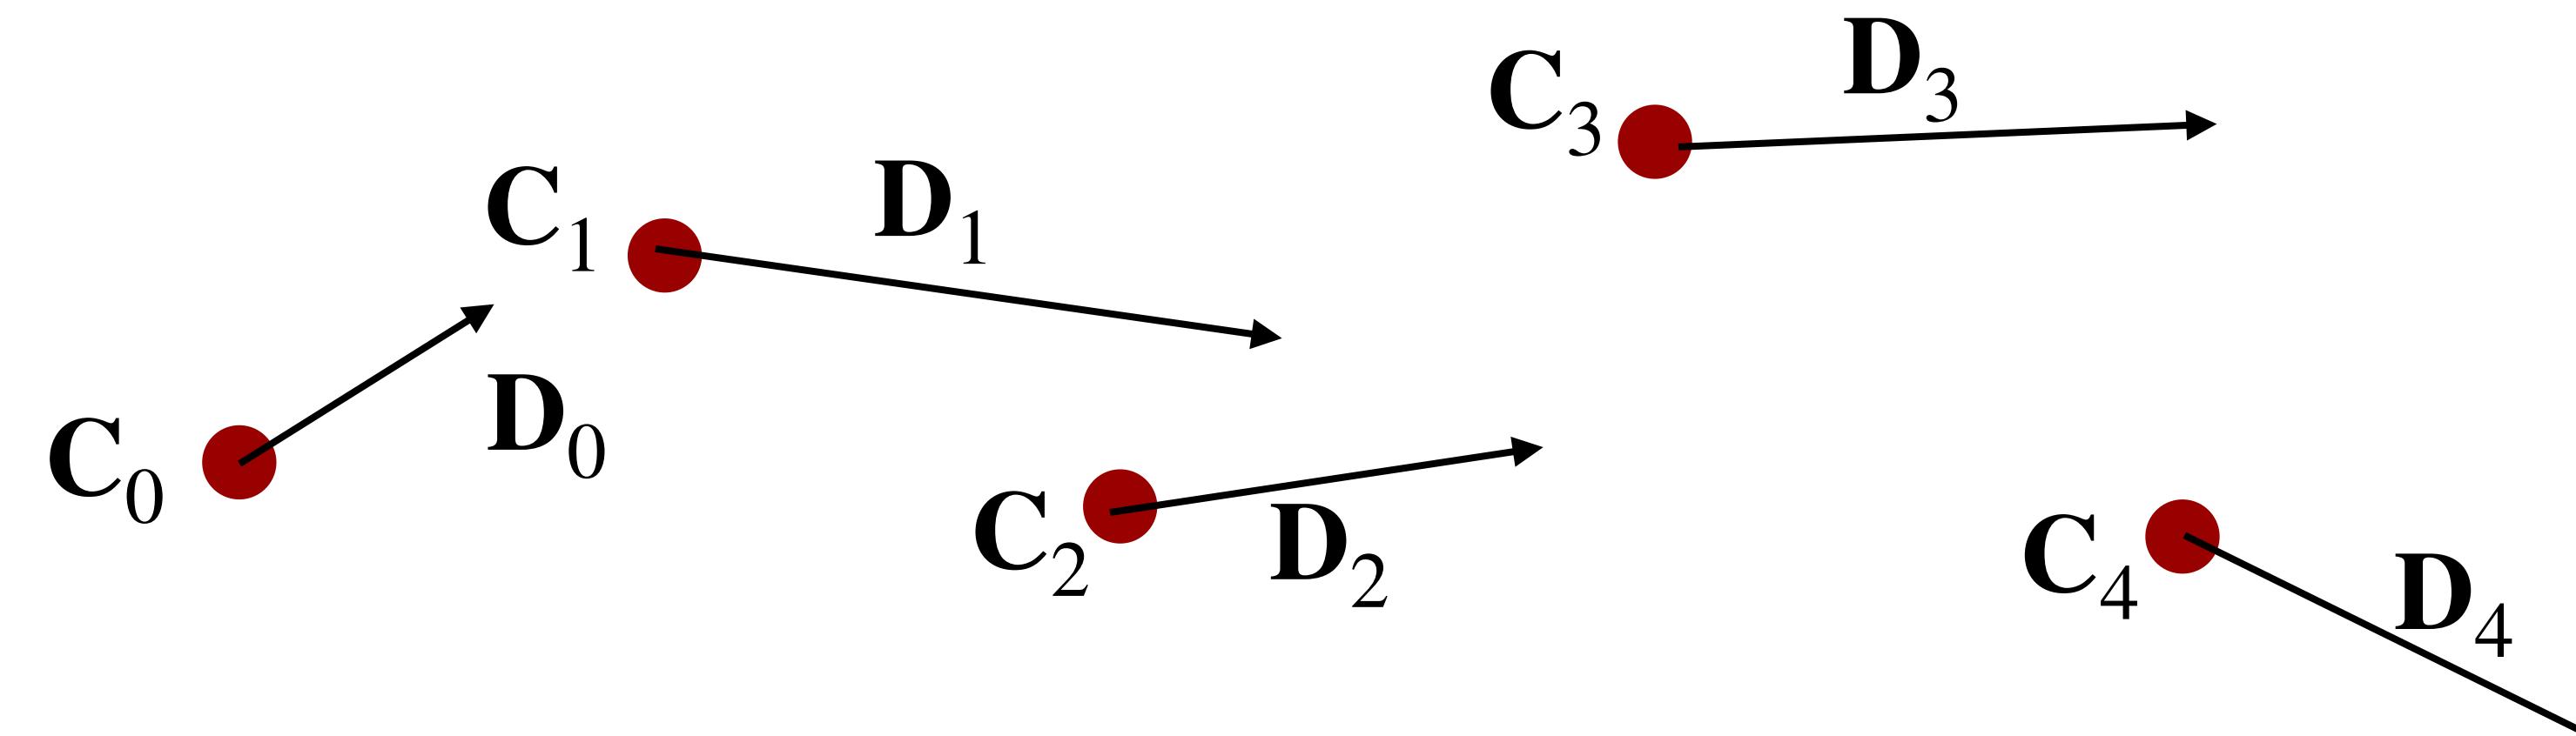

C^2 interpolating splines

- Make each pair of segments share an arbitrary tangent will only give you $C1$.
- Need to solve for D 's such that $C2$ continuity is enforced between segments.

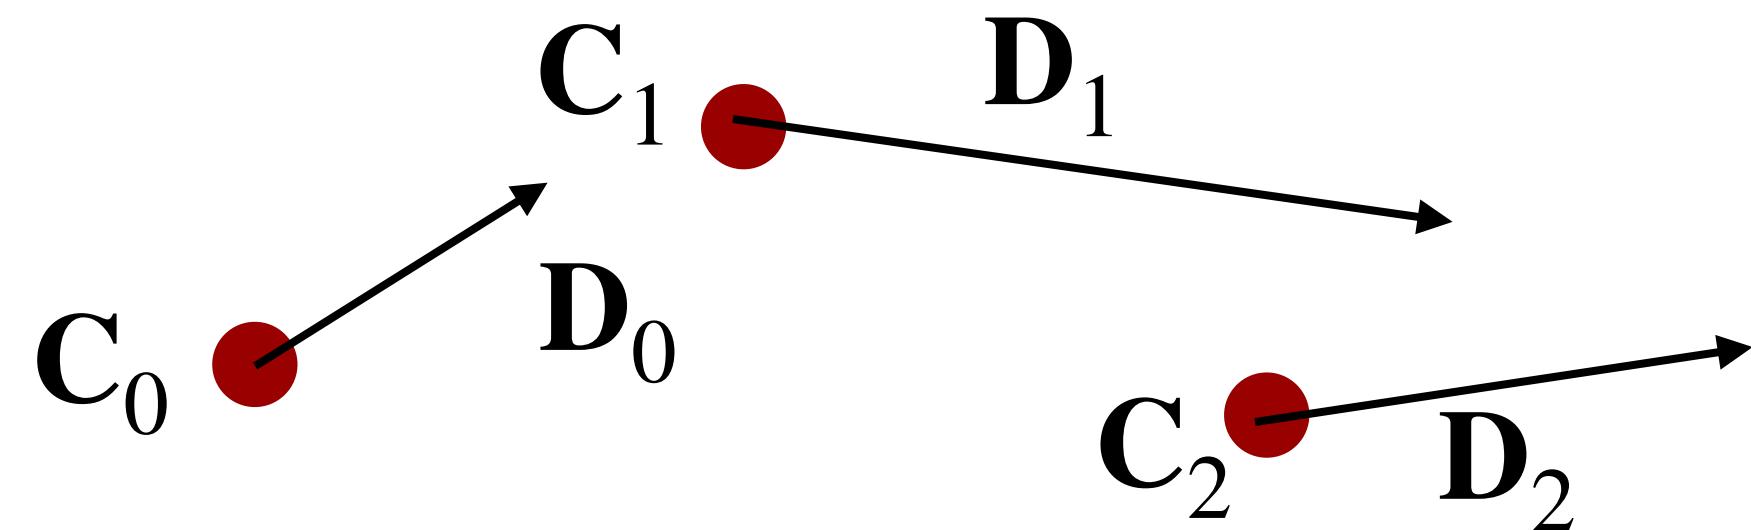

C^2 interpolating splines

- If we want to create a Bezier curve between each pair of consecutive points, what are Bezier control points in terms of C's and D's?
